# THE ANGULAR FRAMEWORK

- this is a highly-abstracted JS (TS) framework
- it creates SPAs ( Single-page applications )
- developed by Google
- it creates an application that runs more like a phone app
- ONLY the parts that change get re-rendered

- an Angular app is made up of Components
    - What's a component?
        - a self-contained unit comprised of:
            - HTML
            - CSS
            - TypeScript
            - a testing module
