REST → REpresentational State Transfer

   – if an API applies to the principles, it is RESTful

– the API is stateless → it does not maintain data

– client/server → the client (frontend/user) and the
       server (API) are independent

– if you have multiple APIs/components, they
       are ALSO independent

– each request to the API is completely independent
       of all others
